20 September 2023

Atlassian Pty Ltd

Level 6, 341 George St

Sydney NSW 2000

AUSTRALIA

To Whom It May Concern,

The Missing Link was engaged by Atlassian to perform a code-assisted web application penetration test of the Beacon web application and its integrations with Microsoft Teams, Slack, and Security Information and Event Management (SIEM) platforms. Beacon is a cloud-based web application that allows customers to detect, investigate and respond to suspicious user events across multiple Atlassian cloud products. Alerts are raised in Beacon and can be forwarded to Slack, Microsoft Teams and SIEM platforms.

The objectives of the engagement were to identify exploitable vulnerabilities, subvert standard workflows, gain unauthorised access to the application, sensitive information, or user generated content, and attempt an underlying server compromise.

Automated and manual penetration testing was performed by two security consultants between the 4th of September and the 20th of September 2023 in the cloud staging environment. A white-box methodology was followed, with full access to relevant repositories, development guides, and the Beacon engineering team to ask questions of.

Sincerely,

The Missing Link Security Pty Ltd
